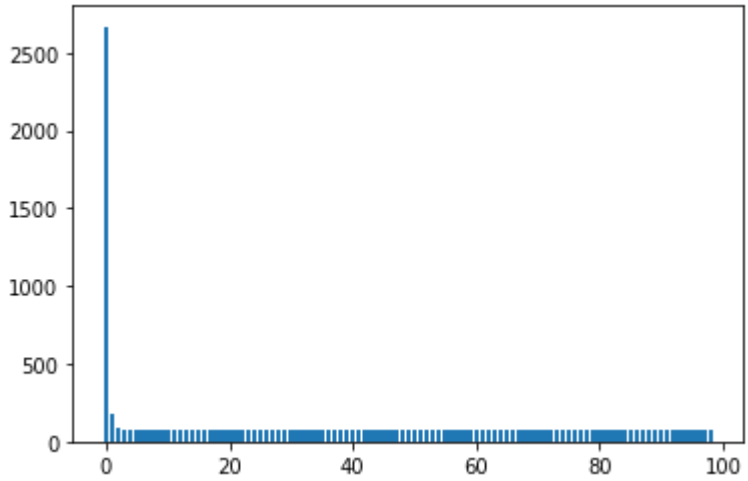
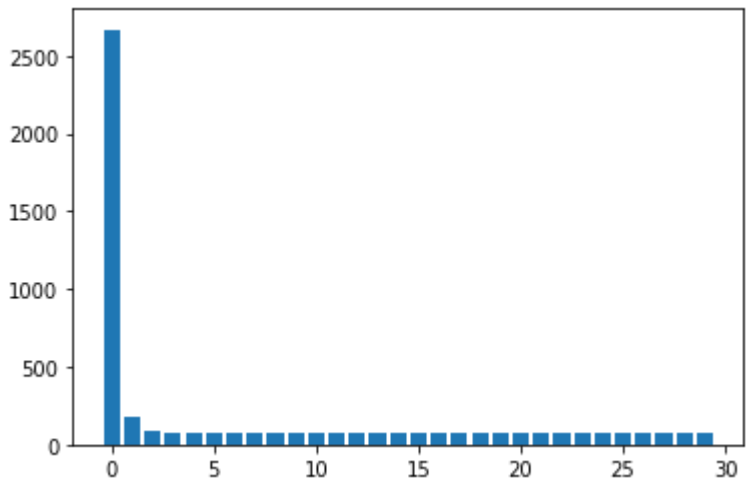
In [157]:

```
# 间隔时间为 1-100 秒的时候，数量有多少
plt.bar(range(len(timestamps_minus_lengths)), timestamps_minus_lengths)
plt.show()
```



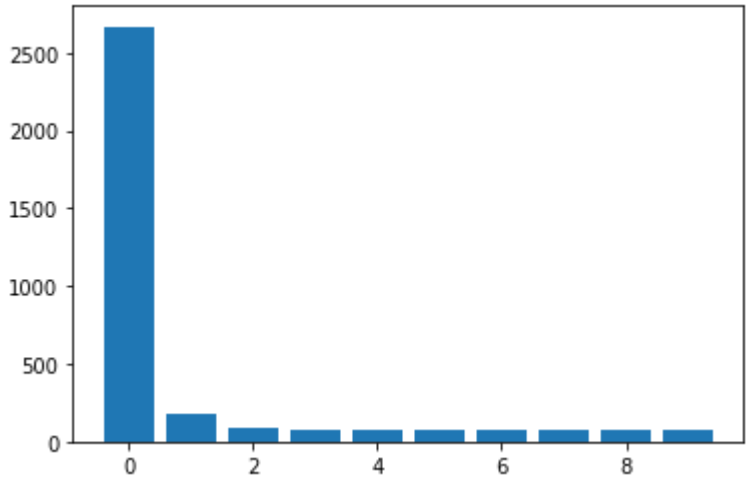
In [158]:

```
# 间隔时间为 1-30 秒的时候，数量有多少
plt.bar(range(len(timestamps_minus_lengths[:30])), timestamps_minus_lengths[:30])
plt.show()
```



In [159]:

```
# 间隔时间为 1-10 秒的时候，数量有多少
plt.bar(range(len(timestamps_minus_lengths[:10])), timestamps_minus_lengths[:10])
plt.show()
```



基本上可以看到间隔时间 3 秒的时候，就稳定差不多了，我们就选 10 秒作为时间段间隔吧。

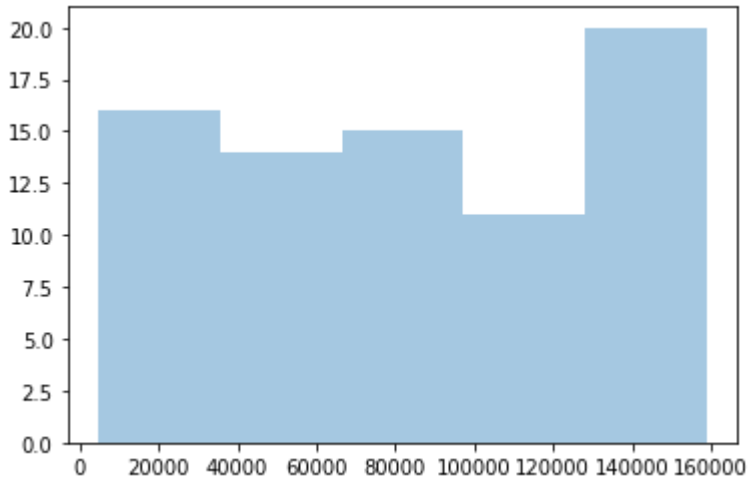
即如果前一条数据和后一条数据间隔超过 10 秒，那就切开

In [160]:

```
# 看看大约分割点在哪个地方分布较多
sns.distplot(np.where(rawdf_timestamp_minus > 10), kde=False)
```

Out[160]:

<matplotlib.axes._subplots.AxesSubplot at 0x130a8a450>



看起来在分割点位置比较平均

开始分割

将大的 DataFrame 按照时间段划分为小的 DataFrames

In [163]:

```
rawdf['timestamp_minus'] = rawdf_timestamp_minus
```

In [164]:

```
rawdf
```

Out[164]:

163493	AA00001	AAA9102001	189	115.822018	28.705936	0	

163494 rows × 15 columns

In [166]:

```
rawdf[0: 1]
```

Out[166]:

	vehicleplatenumber	device_num	direction_angle	lng	lat	acc_state	right_t
0	AA00001	AAA9102001	120	115.944523	28.651165	1	

In [173]:

```
from copy import deepcopy
```

In [174]:

```
count = 10
start, end = 0, 0
rawdf_subs = []
for index, row in rawdf.iterrows():
    # 如果间隔时间超过阈值，那么就切开
    if row.timestamp_minus > 10:
        end = index
        # 切开
        rawdf_sub = rawdf[start: end]
        start = end
        # 汇总到列表
        rawdf_subs.append(deepcopy(rawdf_sub))
```

看看切开的结果，第一段、第二段数据，验证下没问题。从第二段数据开始，第一条数据的 timestamp_minus 应该大于 10

In [180]:

```
rawdf_subs[0]

```
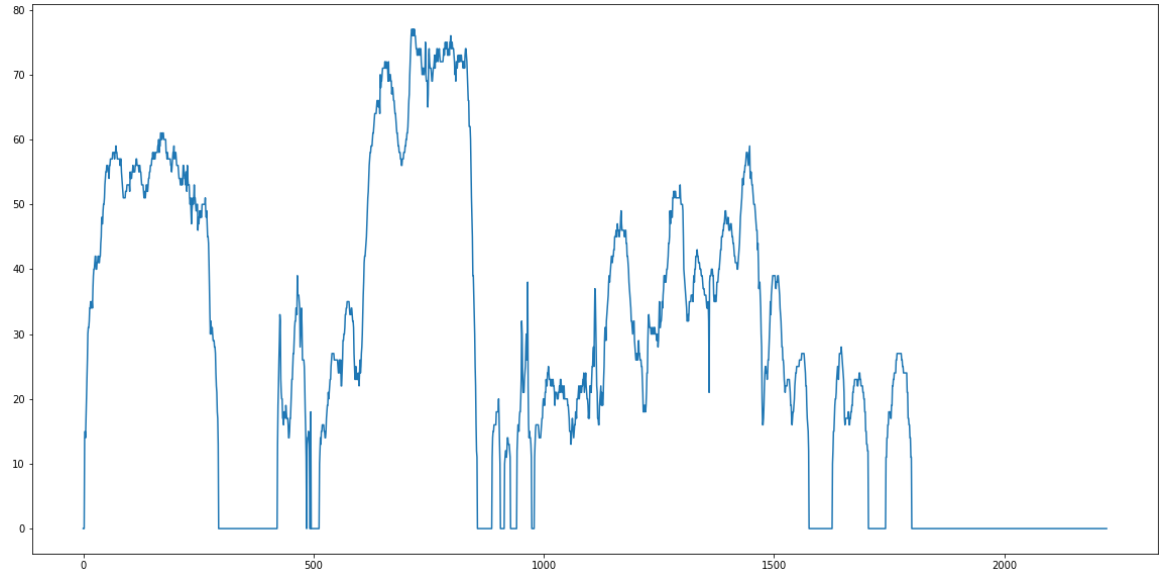
30331    0
30332    0
Name: gps_speed, Length: 2223, dtype: int64
```

In [300]:

```
plt.figure(figsize=(20, 10))
plt.plot(range(len(speed)), speed)
plt.show()
```



可以看到开了好多段，有加速有减速

速度平滑（已废弃）

但原始数据有点过于极端，比如速度数据会突然变成 0。我们用窗口来平滑一下，这里使用汉宁窗口，hanning，即利用窗口卷积平滑。

In [305]:

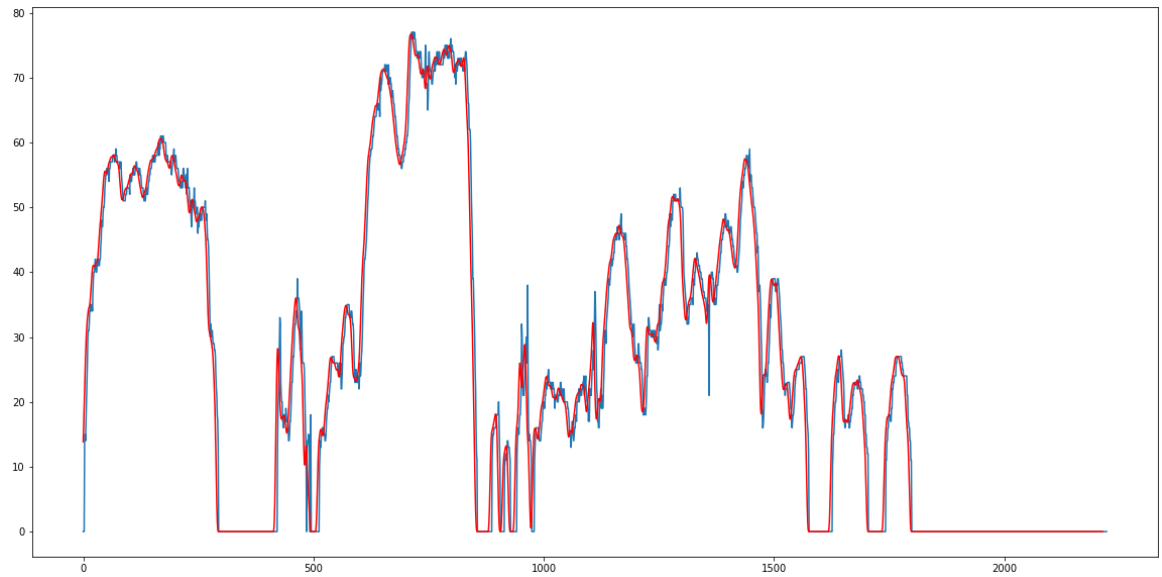
```
# 窗口大小为 10，即窗口内进行卷积操作
hanning_window_size = 10
```

In [306]:

```
hanning_weights = np.hanning(hanning_window_size)
speed_smooth = np.convolve(hanning_weights / hanning_weights.sum(), speed)[hanning_window_size - 1: -hanning_window_size + 1]
```

In [307]:

```
plt.figure(figsize=(20, 10))
plt.plot(range(len(speed)), speed)
plt.plot(range(len(speed_smooth)), speed_smooth, color='red')
plt.show()
```



目前来看作用不大，那就用原数据吧。

加速度处理

下面来分析下加速度情况

In [309]:

```
# 下移一行，方便前后速度作差
segdf_shift = segdf.shift(1)
```

In [310]:

```
segdf_speed_minus = segdf['gps_speed'] - segdf_shift['gps_speed']
```

In [312]:

```
segdf_speed_minus.describe()
```

Out[312]:

```
count    2222.000000
mean        0.000000
std         1.828535
min       -18.000000
25%         0.000000
50%         0.000000
75%         0.000000
max        18.000000
Name: gps_speed, dtype: float64
```

In [314]:

```
# 加速度 = 速度除以时间
segdf['acc'] = segdf_speed_minus / segdf['timestamp_minus']
```

In [319]:

```
segdf['acc'] = segdf['acc'].fillna(0)
```

In [320]:

```
segdf
```

Out[320]:

30332	AA00001	AAA9102001	53	115.822050	28.705865	0	

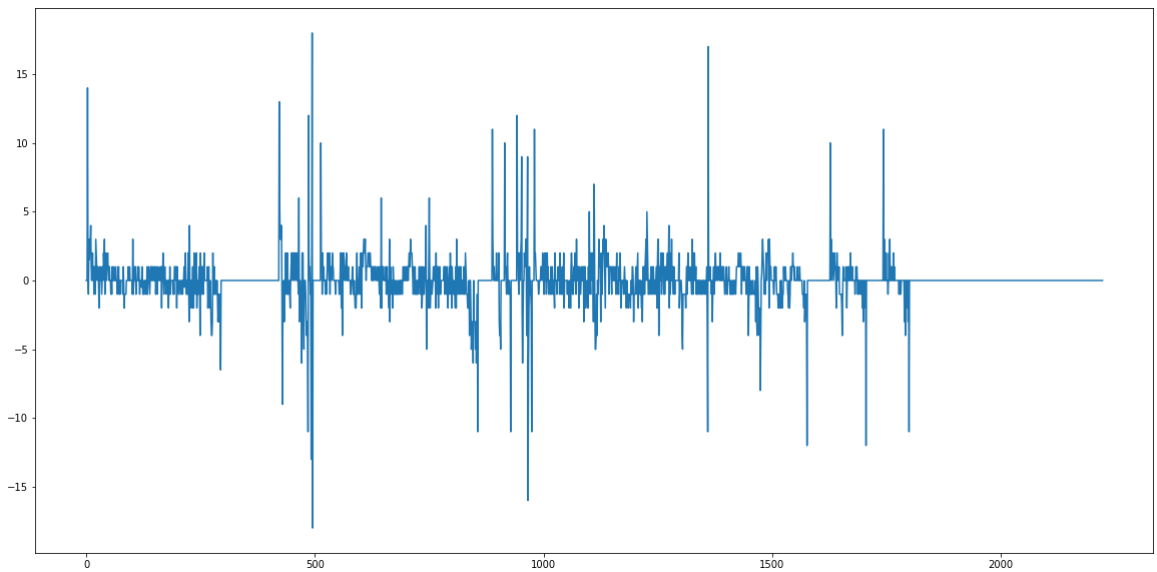
2223 rows × 16 columns

In [321]:

```
acc = segdf.acc
```

In [327]:

```
# 绘制加速度数据
plt.figure(figsize=(20, 10))
plt.plot(range(len(acc)), acc)
plt.show()
```



加速度数据平滑（已废弃）

其实照理来说加速度还蛮准的，不是脏数据。但原始数据有点过于极端。我们用窗口来平滑一下，这里还是使用汉宁窗口。

In [328]:

```
# 窗口大小为 5，即窗口内进行卷积操作
hanning_window_size = 5
```

In [330]:

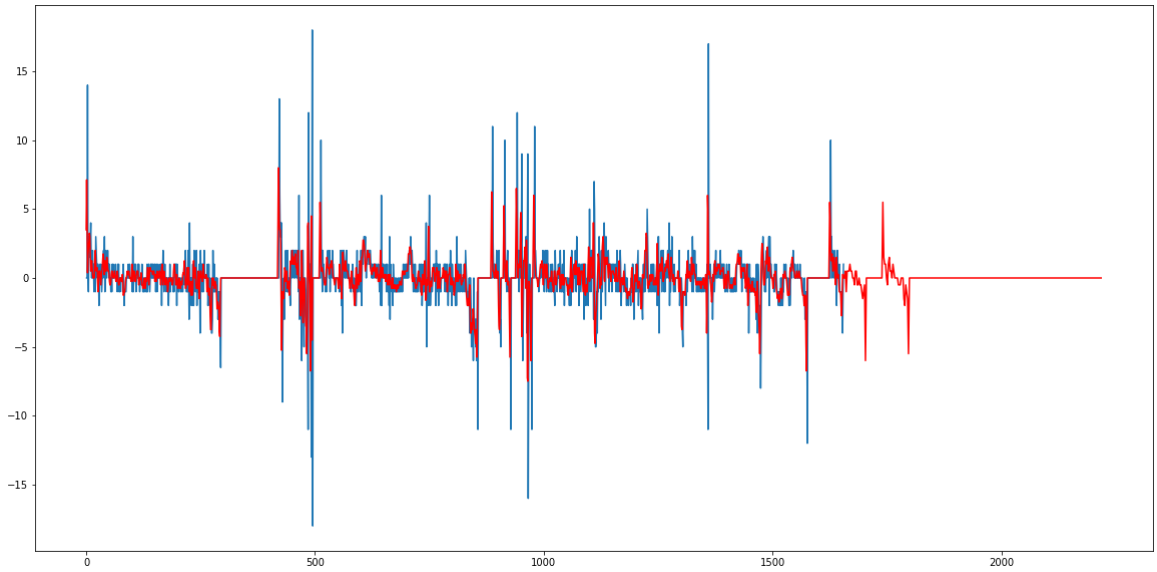
```
hanning_weights = np.hanning(hanning_window_size)
acc_smooth = np.convolve(hanning_weights / hanning_weights.sum(), acc)[hanning_window_size - 1: -h
anning_window_size + 1]
```

In [331]:

```
# 绘制平滑后的效果
plt.figure(figsize=(20, 10))
plt.plot(range(len(acc_smooth)), acc_smooth, color='red')
plt.show()
```

In [333]:

```
# 平滑前和平滑后的对比
plt.figure(figsize=(20, 10))
plt.plot(range(len(acc)), acc_speed, label='raw')
plt.plot(range(len(acc_smooth)), acc_smooth, label='smooth', color='red')
plt.show()
```



窗口卷积平滑了之后，可以看到非常极端的数据就去除了。

所以我们后面就用平滑加速度吧，将平滑后的加速度赋值为加速度

统计下

In [340]:

```
segdf
```

Out[340]:

3. 聚类处理

示例

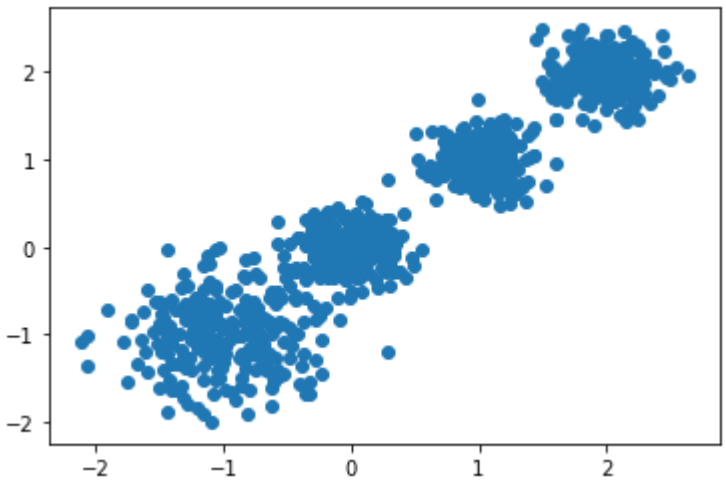
首先我们随机创建一些二维数据作为训练集，选择二维特征数据，主要是方便可视化。代码如下：

In [344]:

```
import matplotlib.pyplot as plt
from sklearn.datasets.samples_generator import make_blobs

# X为样本特征，Y为样本簇类别，共1000个样本，每个样本2个特征，对应x和y轴，共4个簇，
# 簇中心在[-1,-1], [0,0],[1,1], [2,2]， 簇方差分别为[0.4, 0.2, 0.2]
X, y = make_blobs(n_samples=1000, n_features=2, centers=[[-1, -1], [0, 0], [1, 1], [2, 2]],
                  cluster_std=[0.4, 0.2, 0.2, 0.2], random_state=9)

plt.scatter(X[:, 0], X[:, 1], marker='o')  # 假设暂不知道y类别，不设置c=y，使用kmeans聚类
plt.show()
```

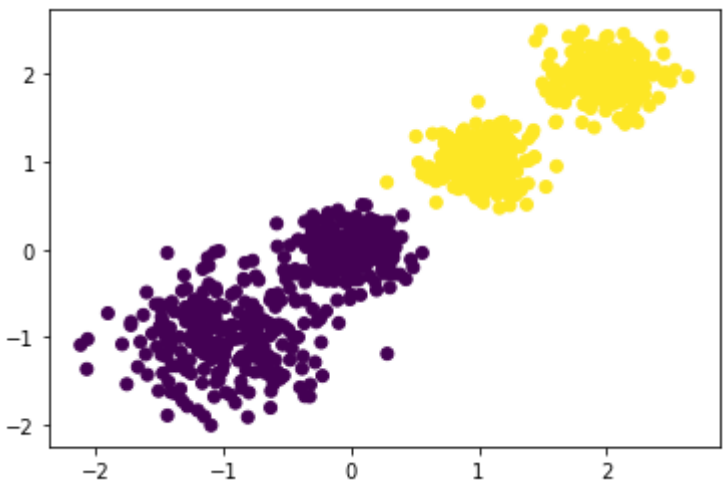


现在我们来用K-Means聚类方法来做聚类，首先选择k=2，代码如下：

In [345]:

```
from sklearn.cluster import KMeans

y_pred = KMeans(n_clusters=2, random_state=9).fit_predict(X)
plt.scatter(X[:, 0], X[:, 1], c=y_pred)
plt.show()
```



现在我们来看看我们用Calinski-Harabasz Index评估的聚类分数，分数越高聚的越好

In [348]:

```
from sklearn import metrics
print(metrics.calinski_harabaz_score(X, y_pred))
```

3116.1706763322227

/usr/local/lib/python3.7/site-packages/sklearn/utils/deprecation.py:85: DeprecationWarning: Function calinski_harabaz_score is deprecated; Function 'calinski_harabaz_score' has been renamed to 'calinski_harabasz_score' and will be removed in version 0.23.
  warnings.warn(msg, category=DeprecationWarning)

准备数据

下面让我们把现有的速度和加速度数据变成 X

In [404]:

```
segdf['speed'] = segdf['gps_speed']
```

In [405]:

```
X = segdf[['gps_speed', 'acc']]
```

In [406]:

```
X
```

Out[406]:

	gps_speed	acc
28110	0	0.0
28111	0	0.0
28112	0	0.0
28113	14	14.0
28114	15	0.5
28115	14	-1.0
28116	17	3.0
28117	20	1.5
28118	23	3.0
28119	26	3.0
28120	30	4.0
28121	31	1.0
28122	31	0.0
28123	32	1.0
28124	34	2.0
28125	34	0.0
28126	35	1.0
28127	34	-1.0
28128	35	1.0
28129	35	0.0
28130	34	-1.0
28131	37	3.0
28132	39	2.0
28133	40	1.0
28134	40	0.0
28135	41	1.0
28136	42	1.0

30319	0	0.0
30320	0	0.0
30321	0	0.0
30322	0	0.0
30323	0	0.0
30324	0	0.0
30325	0	0.0
30326	0	0.0
30327	0	0.0
30328	0	0.0
30329	0	0.0
30330	0	0.0
30331	0	0.0
30332	0	0.0

2223 rows × 2 columns

归一化一下

In [407]:

```
from sklearn.preprocessing import MinMaxScaler
```

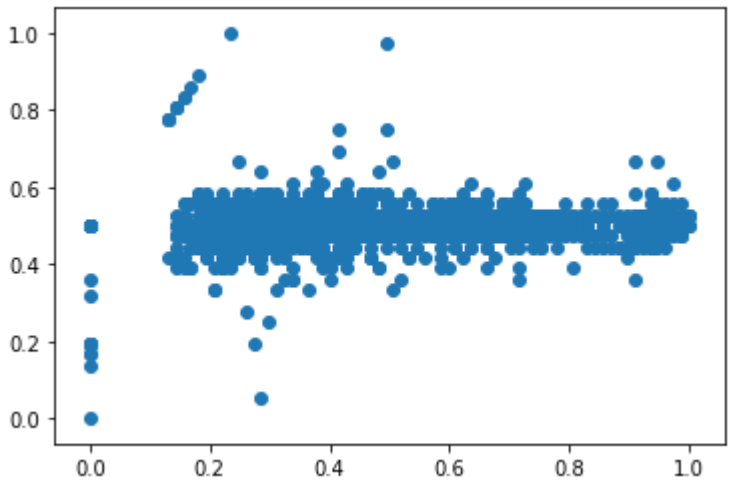
In [408]:

```
X = MinMaxScaler().fit_transform(X)
```

看看效果

In [413]:

```
plt.scatter(X[:, 0], X[:, 1], marker='o')
plt.show()
```



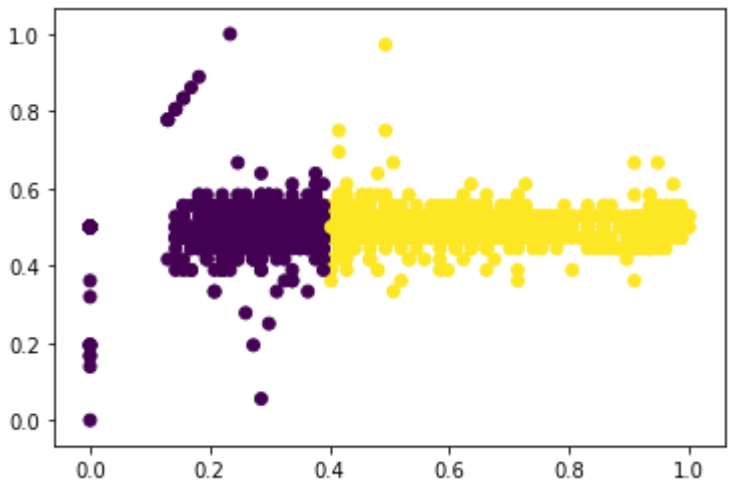
初步尝试 KMeans

尝试 2 堆聚类

In [414]:

```
from sklearn.cluster import KMeans

y_pred = KMeans(n_clusters=2, random_state=9).fit_predict(X)
plt.scatter(X[:, 0], X[:, 1], c=y_pred)
plt.show()
```



In [415]:

```
from sklearn import metrics
print(metrics.calinski_harabaz_score(X, y_pred))
```

6019.884015952393

/usr/local/lib/python3.7/site-packages/sklearn/utils/deprecation.py:85: DeprecationWarning: Function calinski_harabaz_score is deprecated; Function 'calinski_harabaz_score' has been renamed to 'calinski_harabasz_score' and will be removed in version 0.23.
  warnings.warn(msg, category=DeprecationWarning)

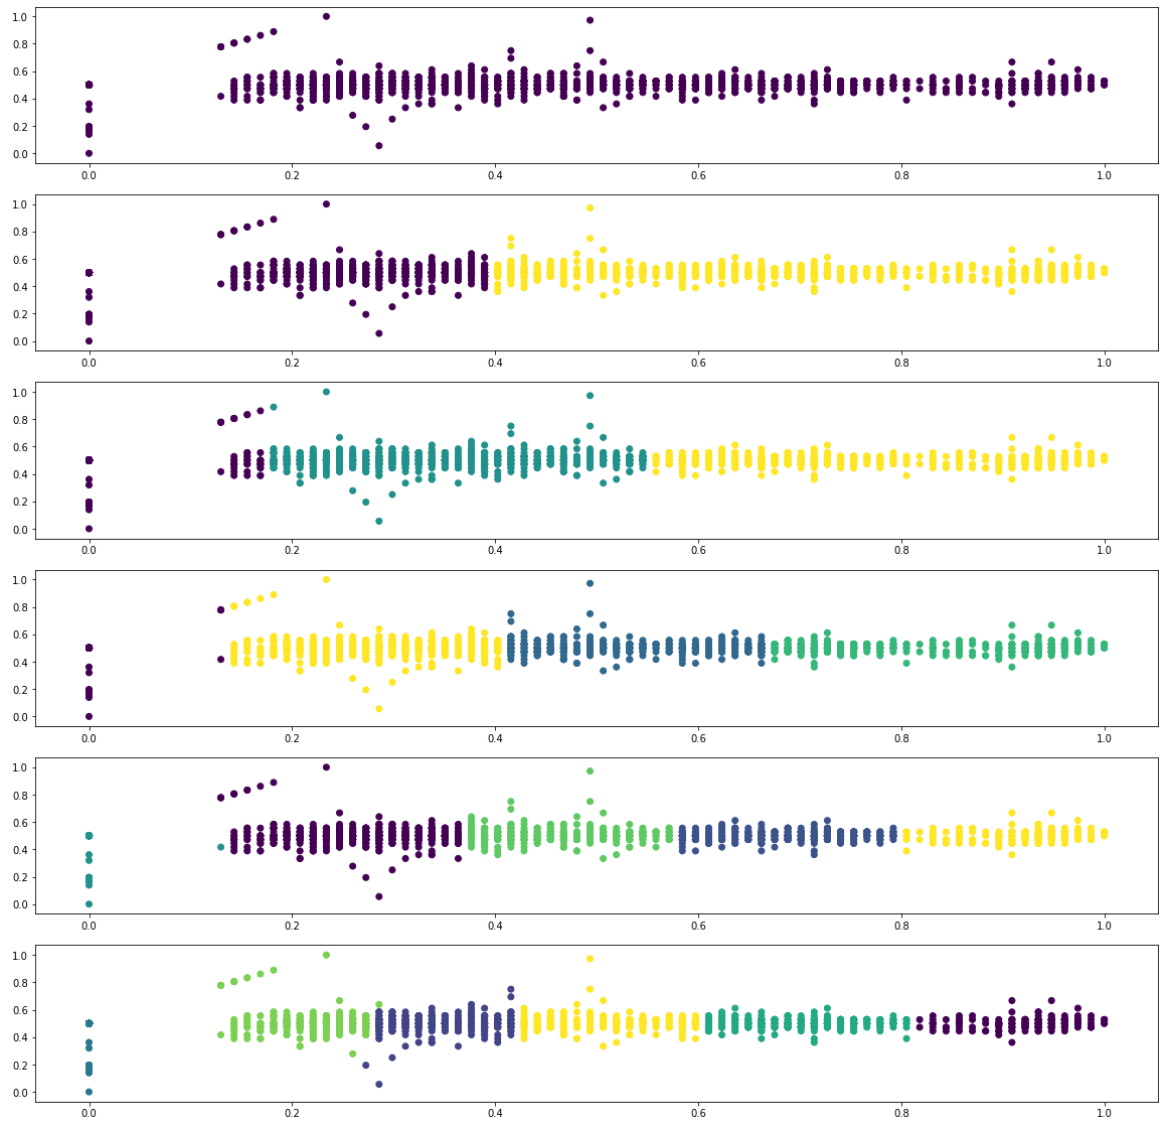
尝试多堆聚类

In [416]:

```
n_clusters = 6
```

In [417]:

```
plt.figure(figsize=(20, 20))
for i in range(1, n_clusters + 1):
    plt.subplot(n_clusters, 1, i)
    y_pred = KMeans(n_clusters=i, random_state=9).fit_predict(X)
    plt.scatter(X[:, 0], X[:, 1], c=y_pred)
plt.show()
```



发现都是纵向切割的，根据速度切割，而不是根据加速度切割。但现在加速和减速其实是应该明显要区别出来的，所以再引入一维数据。

筛选数据

这里我们把速度和加速度为 0 的数据筛掉再试试。

In [418]:

```
segdf_filtered = segdf[(segdf.speed > 0) & (segdf.acc != 0)]
```

In [419]:

```
segdf_filtered
```

Out[419]:

	vehicleplatenumber	device_num	direction_angle	lng	lat	acc_state	rig
28113	AA00001	AAA9102001	199	115.860926	28.816196	1

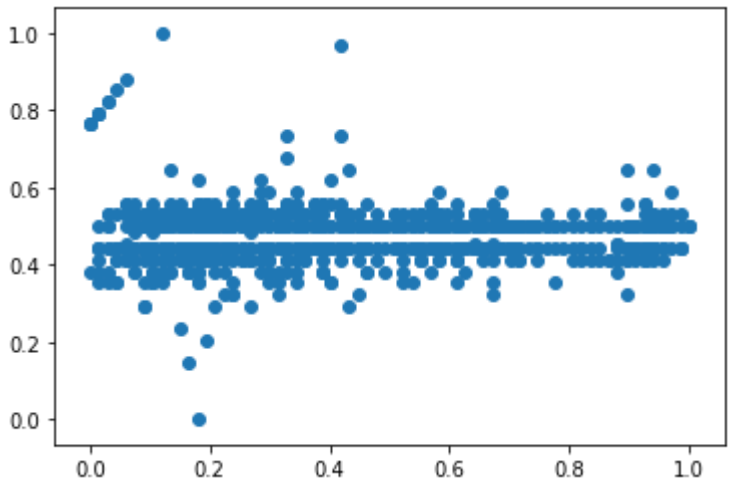
942 rows × 18 columns

看看可视化效果

In [430]:

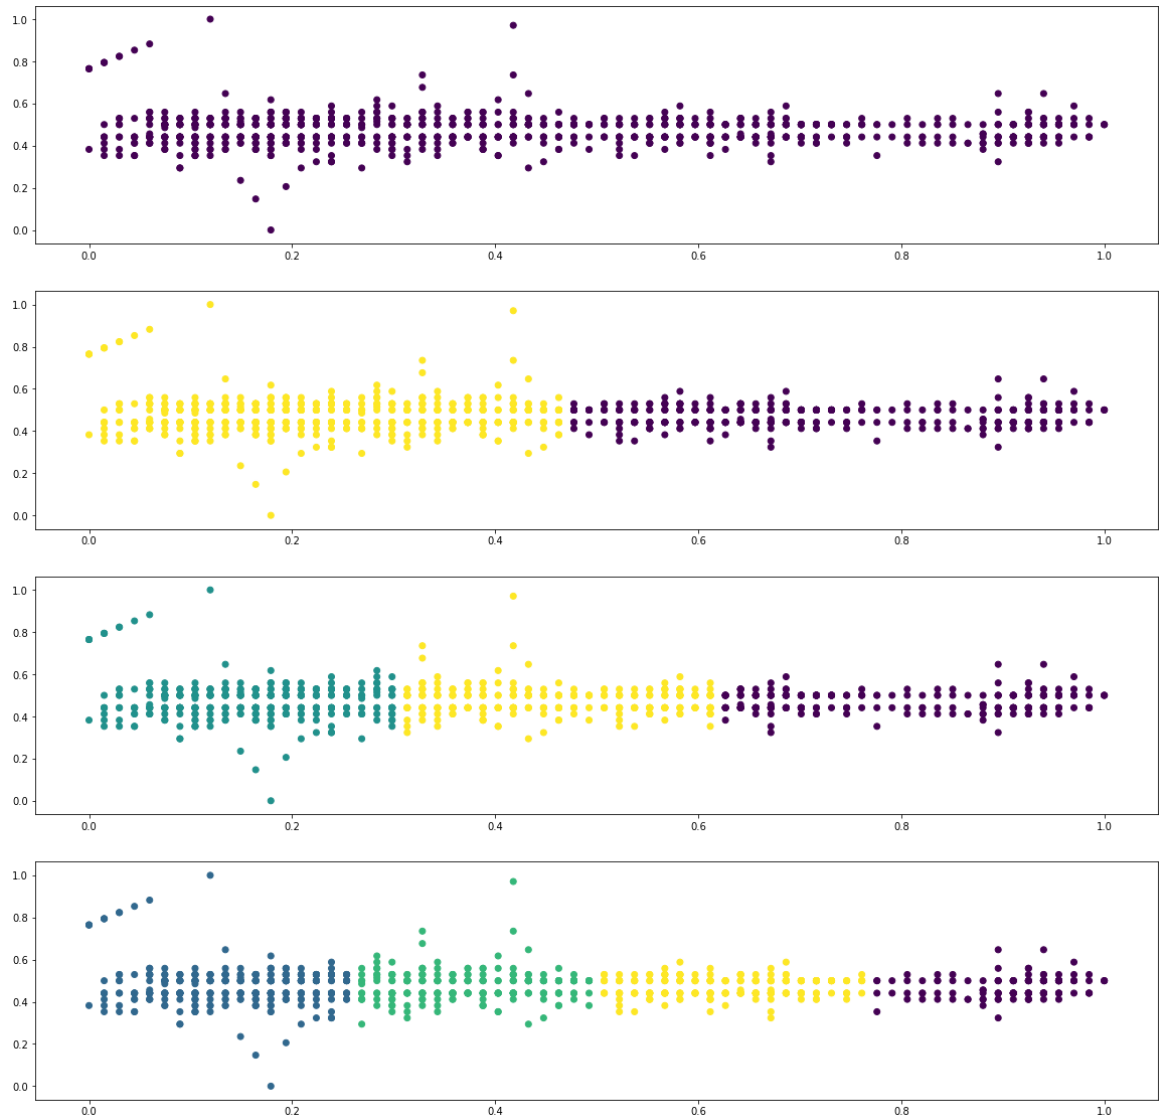
```
X = segdf_filtered[['gps_speed', 'acc']].values
X = MinMaxScaler().fit_transform(X)
plt.scatter(X[:, 0], X[:, 1])
plt.show()
```



尝试聚类

In [431]:

```
n_clusters = 4
plt.figure(figsize=(20, 20))
for i in range(1, n_clusters + 1):
    plt.subplot(n_clusters, 1, i)
    y_pred = KMeans(n_clusters=i, random_state=9).fit_predict(X)
    plt.scatter(X[:, 0], X[:, 1], c=y_pred)
plt.show()
```



依然还是没法把加速减速分开

加速减速速度处理

没法分开怎么办呢？单独加一维来辅助吧，定义一维加速状态，比如加速就是 1，减速就是 -1，停止就是 0

In [439]:

```
# 定义加速、减速、停止的状态
def speed_state(acc):
    if acc > 0: return 1
    if acc == 0: return 0
    if acc < 0: return -1
```

In [454]:

```
segdf['speed_state'] = segdf['acc'].apply(speed_state)
```

In [461]:

```
X = segdf[['speed', 'acc', 'speed_state']].values
X = MinMaxScaler().fit_transform(X)
```

In [462]:

```
# 聚类 2 堆 - 8 堆
n_clusters = 10
figsize_x = 10
plt.figure(figsize=(10, figsize_x * n_clusters))
for i in range(2, n_clusters + 1):
    ax = plt.subplot(n_clusters, 1, i)
    ax.set_title(f'{i} clusters')
    y_pred = KMeans(n_clusters=i, random_state=9).fit_predict(X)
    plt.scatter(X[:, 0], X[:, 1], c=y_pred)
    plt.ylabel('acc')
    plt.xlabel('speed')
plt.show()
```

看 4 堆的数据，我们聚出来了速度高的加速和减速，速度低的加速和减速。

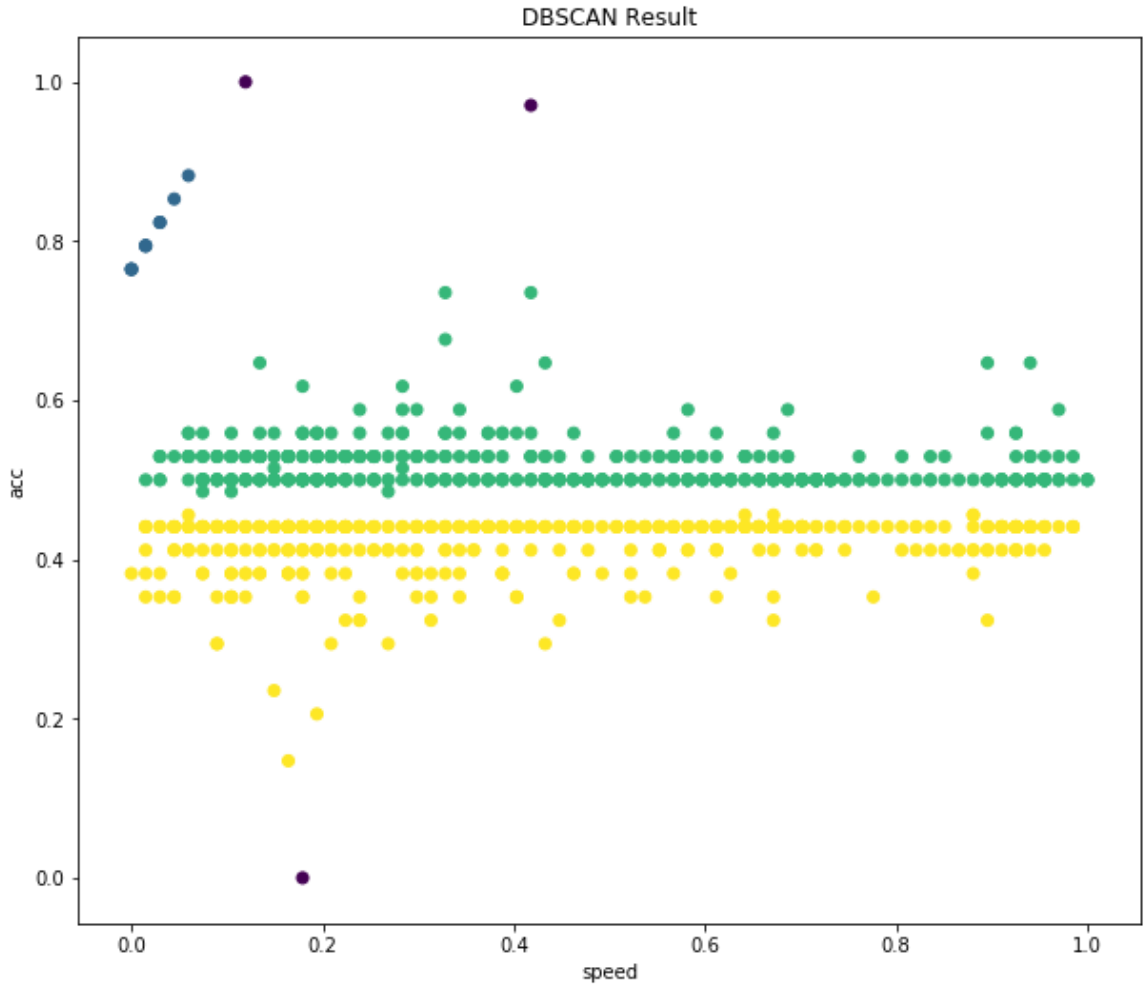
下面我们再尝试其他的聚类方法。

DBScan

基于密度聚类，无法指定堆的数目

In [478]:

```
from sklearn.cluster import DBSCAN
figsize_x = 10
plt.figure(figsize=(10, figsize_x * n_clusters))
ax = plt.subplot(n_clusters, 1, i)
ax.set_title('DBSCAN Result')
y_pred = DBSCAN(eps=0.1).fit_predict(X)
plt.scatter(X[:, 0], X[:, 1], c=y_pred)
plt.ylabel('acc')
plt.xlabel('speed')
plt.show()
```



In [480]:

```
# 堆数
print(np.unique(y_pred))
```

```
[-1  0  1  2]
```

这里可以看到聚类分成了 4 类。

观察下可以看到有：

- 所有速度的普通加速
- 所有速度的普通减速
- 急加速
- 急减速

还是很不错的！普通加减速和急速加减速分出来了！

可能数据量不够大，因为我们只拿了一个分段来处理。我们把前面所有的分段拿来看看。

这里先保存下历史数据。

In [485]:

```
segdf10 = segdf
segdf_filtered10 = segdf_filtered
```

In [499]:

```
# 把之前所有的分段都拿来，还是之前一样的预处理方式处理下
segdfs = rawdf_subs
xs = []
for segdf in segdfs:
    segdf_shift = segdf.shift(1)
    # 算速度差值
    segdf_speed_minus = segdf['gps_speed'] - segdf_shift['gps_speed']
    # 算加速度
    segdf['acc'] = segdf_speed_minus / segdf['timestamp_minus']
    segdf['acc'] = segdf['acc'].fillna(0)
    # 速度取别名
    segdf['speed'] = segdf['gps_speed']
    # 过滤 0 速度
    segdf_filtered = segdf[(segdf.speed > 0) & (segdf.acc != 0)]
    # 增加速度状态
    segdf_filtered['speed_state'] = segdf_filtered['acc'].apply(speed_state)
    # 数据
    x = segdf_filtered[['speed', 'acc', 'speed_state']].values
    if not len(x): continue
    x = MinMaxScaler().fit_transform(x)
    x = np.array(x)
    xs.append(x)
```

```
/usr/local/lib/python3.7/site-packages/ipykernel/__main__.py:16: SettingWithCopyWarn
ing:
A value is trying to be set on a copy of a slice from a DataFrame.

See the caveats in the documentation: http://pandas.pydata.org/pandas-docs/stable/in
dexing.html#indexing-view-versus-copy
```

In [565]:

```
X = np.concatenate(tuple(xs), axis=0)
```

In [566]:

```
X.shape
```

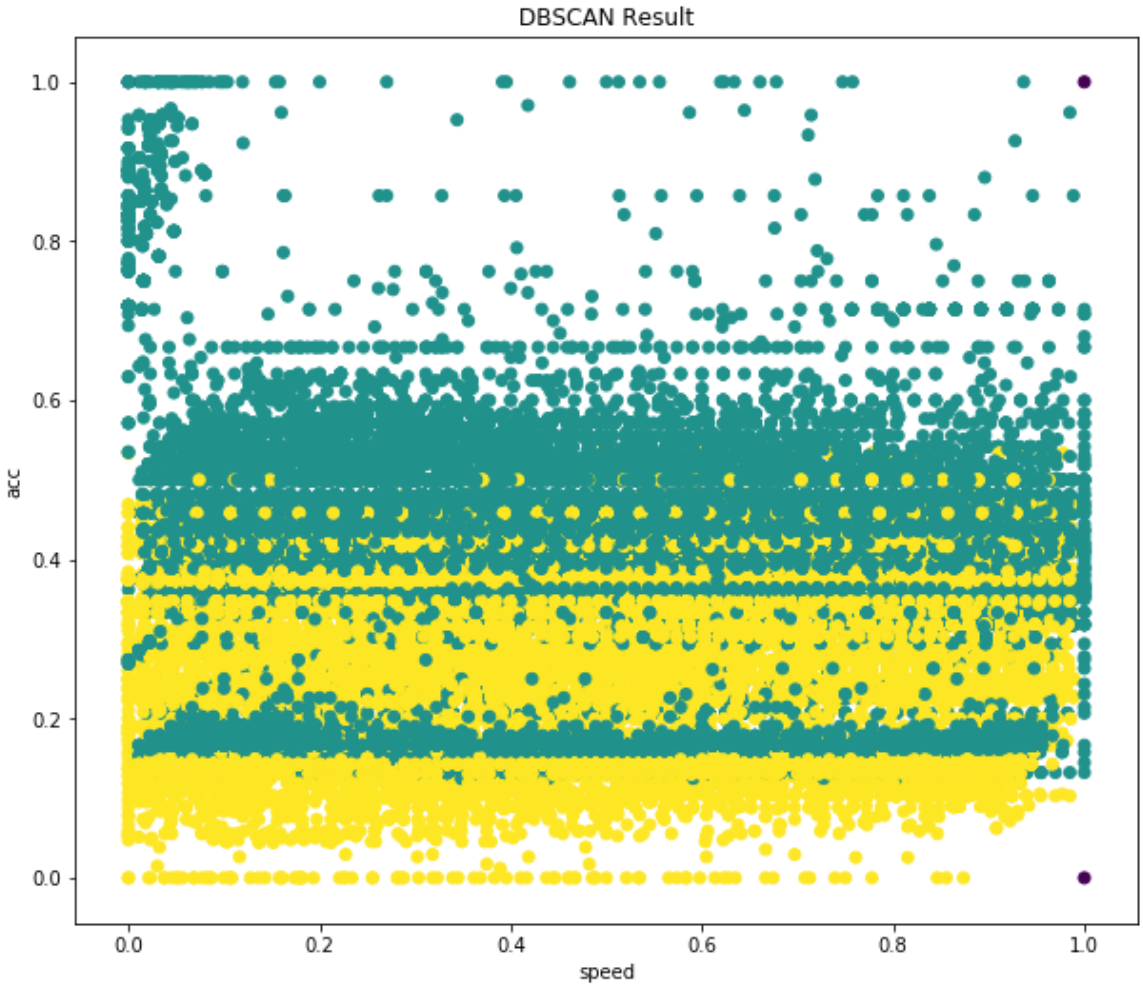
Out[566]:

```
(57693, 3)
```

现在有五万多数据了，来聚类试试

In [504]:

```
from sklearn.cluster import DBSCAN
figsize_x = 10
plt.figure(figsize=(10, figsize_x * n_clusters))
ax = plt.subplot(n_clusters, 1, i)
ax.set_title('DBSCAN Result')
y_pred = DBSCAN(eps=0.1).fit_predict(X)
plt.scatter(X[:, 0], X[:, 1], c=y_pred)
plt.ylabel('acc')
plt.xlabel('speed')
plt.show()
```

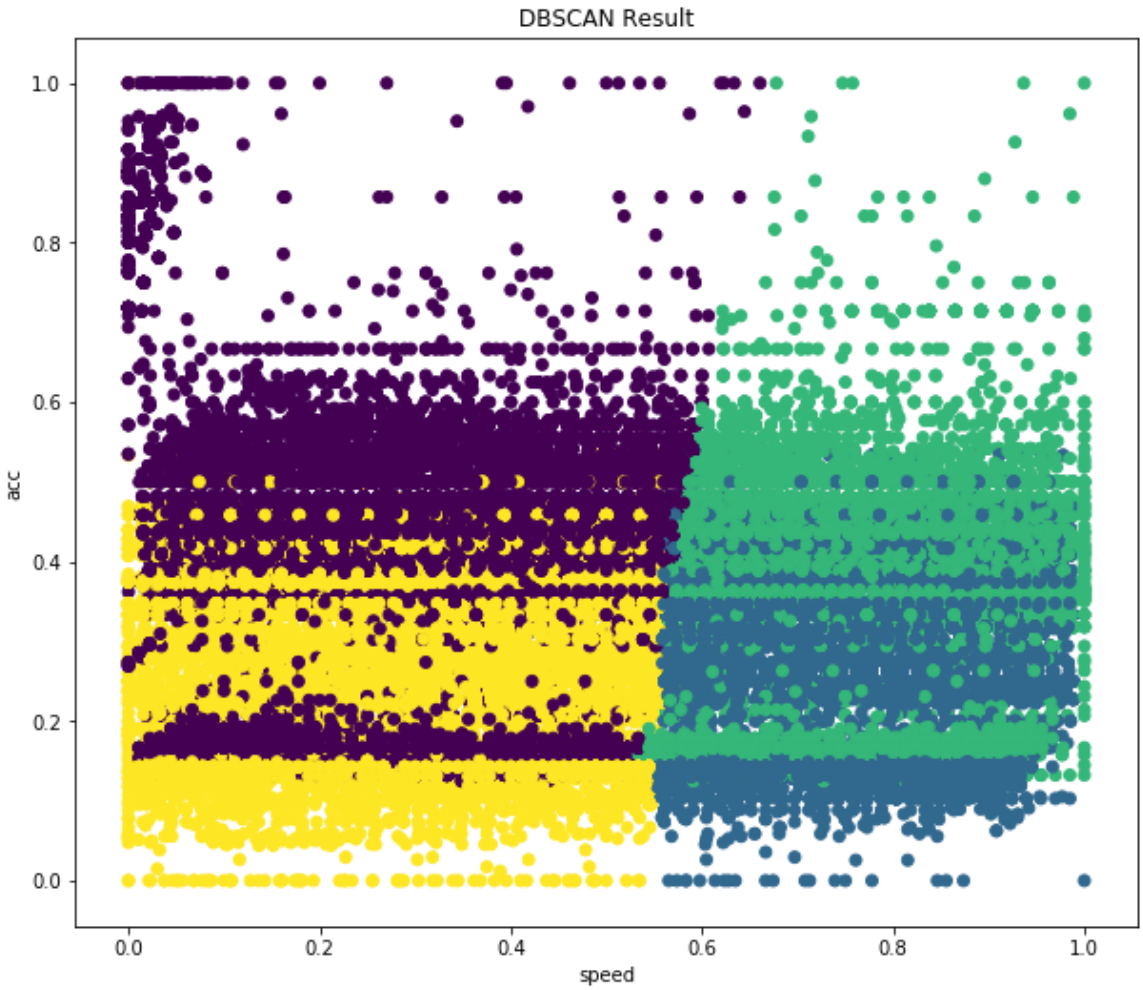


不太行，数据量看来还是不能太大啊，这全都占满了，密度太大了啊。

Kmeans 试试呢再。

In [508]:

```
from sklearn.cluster import KMeans
figsize_x = 10
plt.figure(figsize=(10, figsize_x * n_clusters))
ax = plt.subplot(n_clusters, 1, i)
ax.set_title('DBSCAN Result')
y_pred = KMeans(n_clusters=4).fit_predict(X)
plt.scatter(X[:, 0], X[:, 1], c=y_pred)
plt.ylabel('acc')
plt.xlabel('speed')
plt.show()
```



这个还不错，能分出：

- 高速加速
- 高速减速
- 低速加速
- 低速减速

再适当控制下数量看看 DBSCAN，觉得这个在数据量适当的情况下应该还不错

In [511]:

```
from random import sample
```

In [514]:

```
x.shape
```

Out[514]:

(6040, 3)

In [535]:

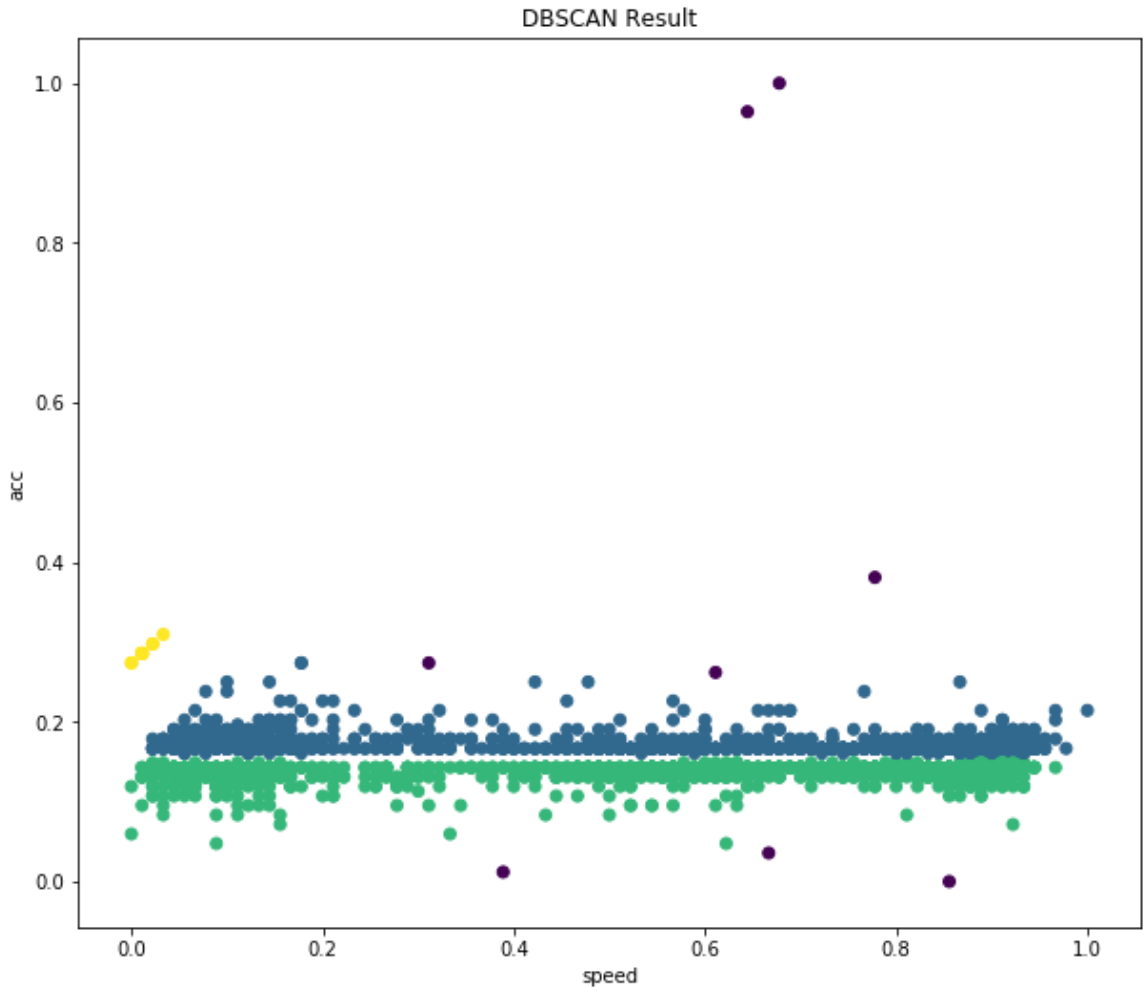
```
X = sample(x.tolist(), 5000)
```

In [536]:

```
X = np.asarray(X)
```

In [547]:

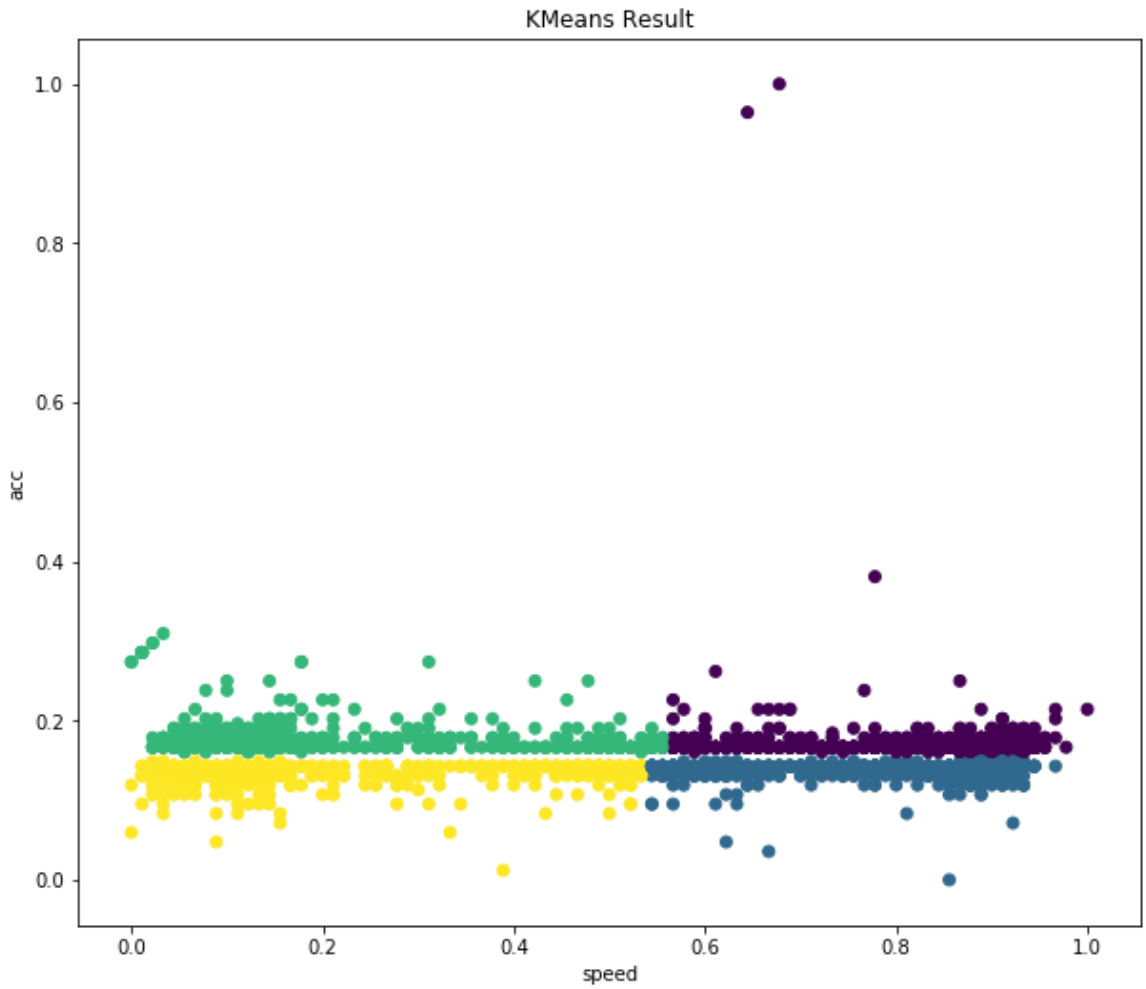
```
from sklearn.cluster import DBSCAN
figsize_x = 10
plt.figure(figsize=(10, figsize_x * n_clusters))
ax = plt.subplot(n_clusters, 1, i)
ax.set_title('DBSCAN Result')
y_pred = DBSCAN(eps=0.05).fit_predict(X)
plt.scatter(X[:, 0], X[:, 1], c=y_pred)
plt.ylabel('acc')
plt.xlabel('speed')
plt.show()
```



不错，再次分出来了。

In [545]:

```
from sklearn.cluster import KMeans
figsize_x = 10
plt.figure(figsize=(10, figsize_x * n_clusters))
ax = plt.subplot(n_clusters, 1, i)
ax.set_title('KMeans Result')
y_pred = KMeans(n_clusters=4).fit_predict(X)
plt.scatter(X[:, 0], X[:, 1], c=y_pred)
plt.ylabel('acc')
plt.xlabel('speed')
plt.show()
```



恩，也基本能分出来的。

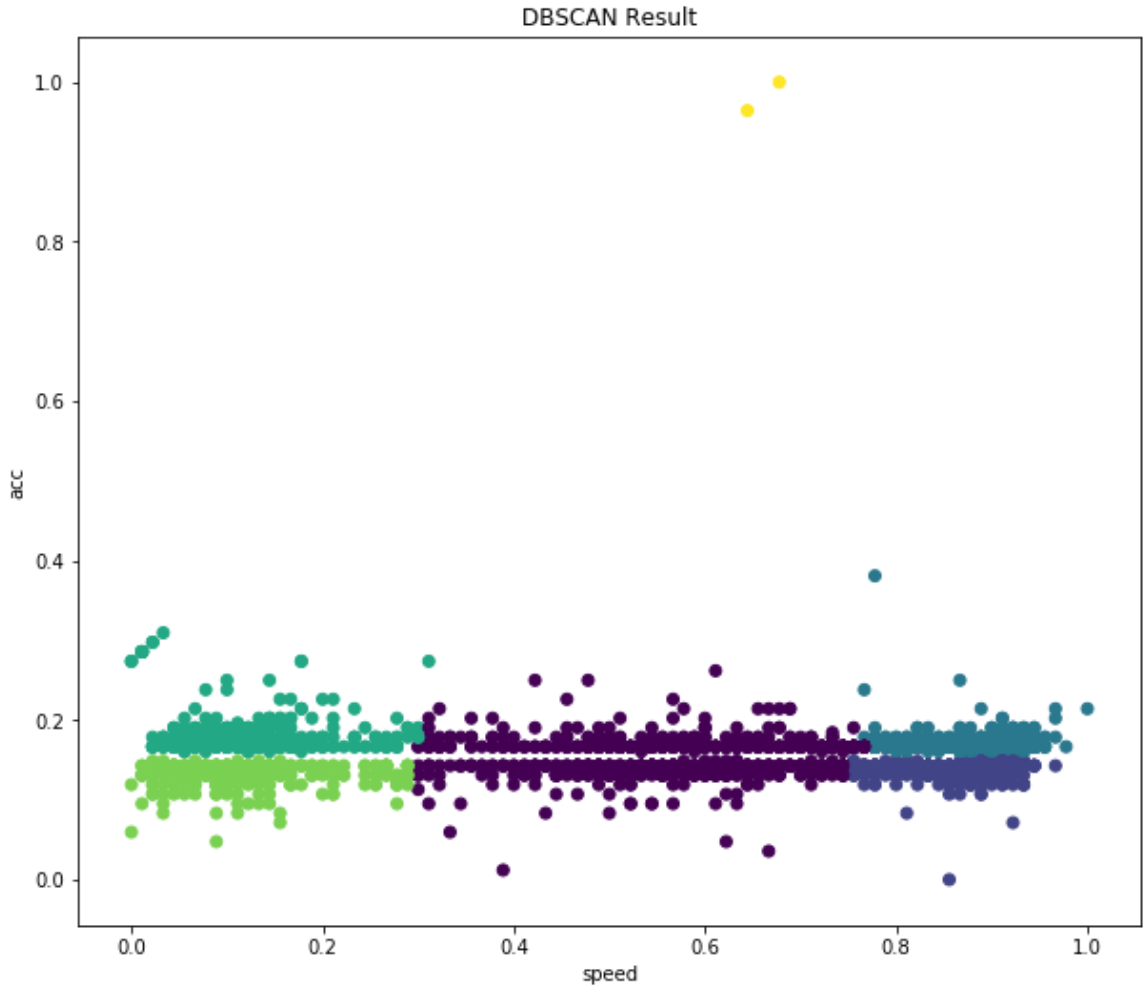
再试试别的聚类。

谱聚类

原理可以搜下

In [551]:

```
from sklearn.cluster import SpectralClustering
figsize_x = 10
n_clusters = 6
plt.figure(figsize=(10, figsize_x * n_clusters))
ax = plt.subplot(n_clusters, 1, i)
ax.set_title('DBSCAN Result')
y_pred = SpectralClustering(n_clusters=n_clusters, gamma=0.4).fit_predict(X)
plt.scatter(X[:, 0], X[:, 1], c=y_pred)
plt.ylabel('acc')
plt.xlabel('speed')
plt.show()
```



层次聚类

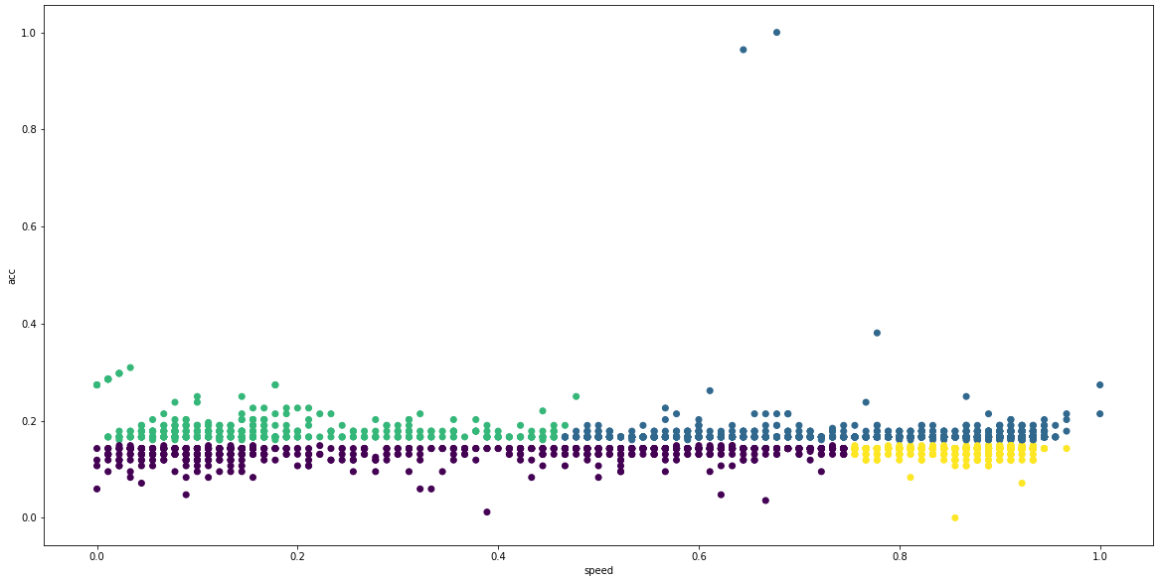
即结合了距离和密度的聚类。

In [570]:

```
X = sample(x.tolist(), 5000)
X = np.asarray(X)
```

In [571]:

```
from sklearn.cluster import AgglomerativeClustering
figsize_x = 10
n_clusters = 4
y_pred = AgglomerativeClustering(n_clusters=n_clusters).fit_predict(X)
plt.figure(figsize=(20, 10))
plt.scatter(X[:, 0], X[:, 1], c=y_pred)
plt.ylabel('acc')
plt.xlabel('speed')
plt.show()
```



混合高斯模型

In [583]:

```
X = np.concatenate(tuple(xs), axis=0)
X.shape
```

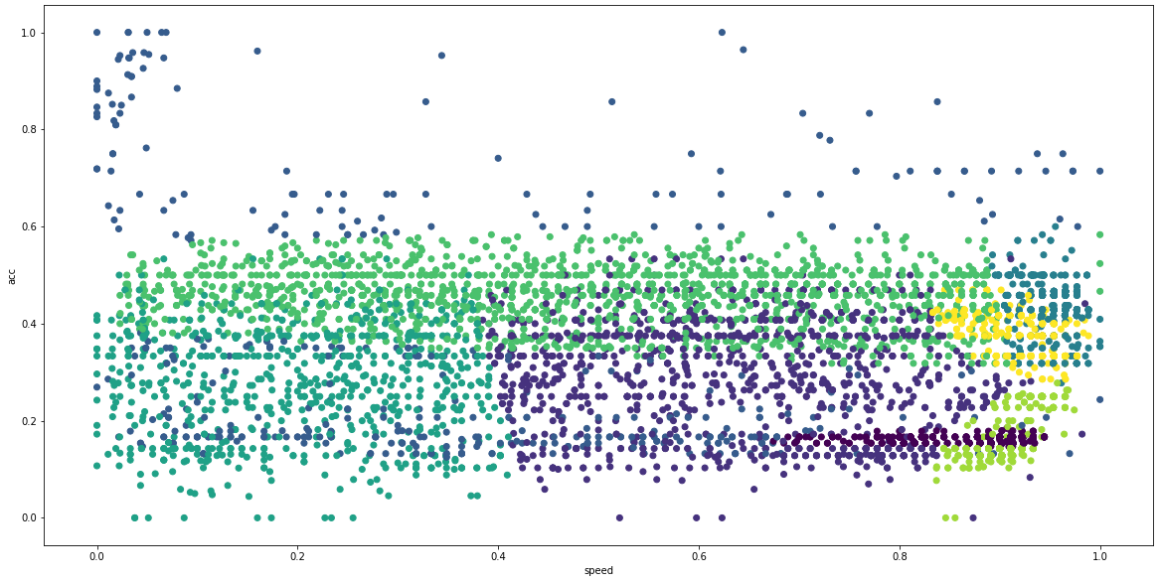
Out[583]:

(57693, 3)

In [596]:

```
X = sample(X.tolist(), 6000)
X = np.asarray(X)

from sklearn.mixture import GaussianMixture
figsize_x = 10
n_clusters = 8
y_pred = GaussianMixture(n_components=n_clusters).fit_predict(X)
plt.figure(figsize=(20, 10))
plt.scatter(X[:, 0], X[:, 1], c=y_pred)
plt.ylabel('acc')
plt.xlabel('speed')
plt.show()
```



可以看到！混合高斯模型能进一步分出来加速度！

目前观测可以分为如下结果：

- 高速急减速
- 高速缓减速
- 高速缓加速
- 高速急加速

还有对应的低速、中速等

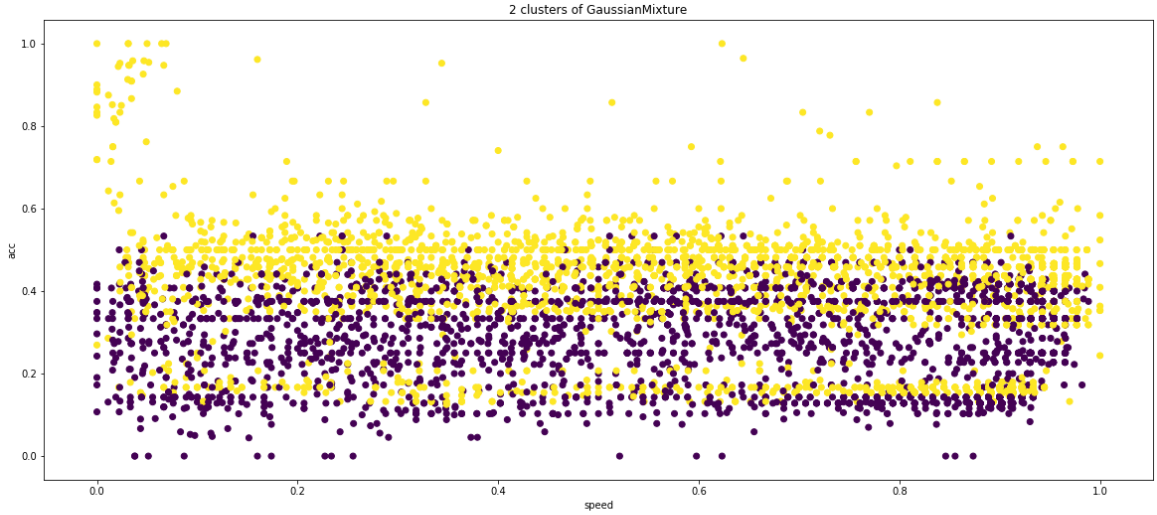
- 中速急减速
- 中速缓减速
- 中速缓加速
- 中速急加速

这个再仔细观察下吧

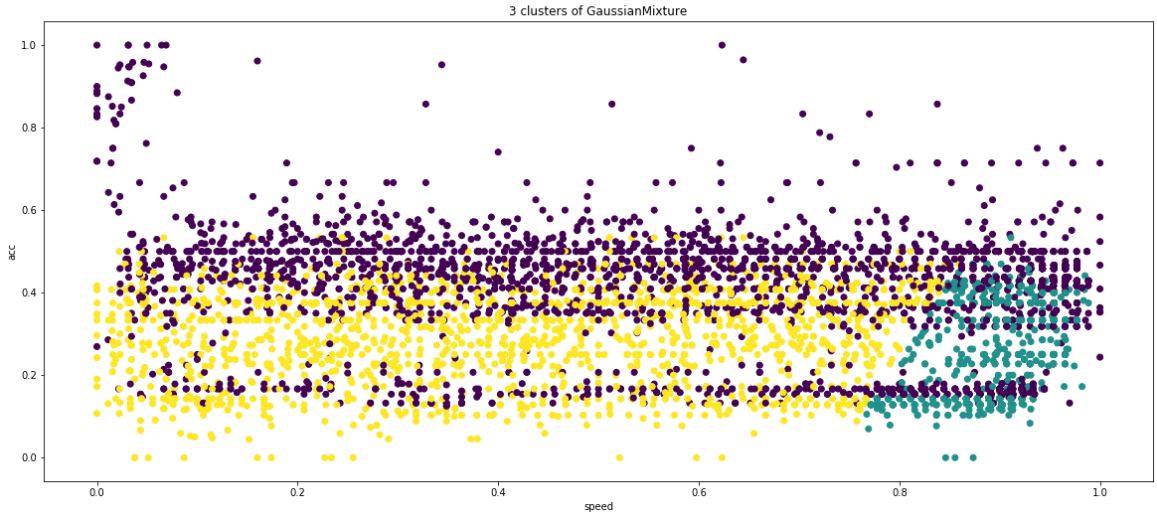
遍历下 cluster 的个数，打印出来

In [599]:

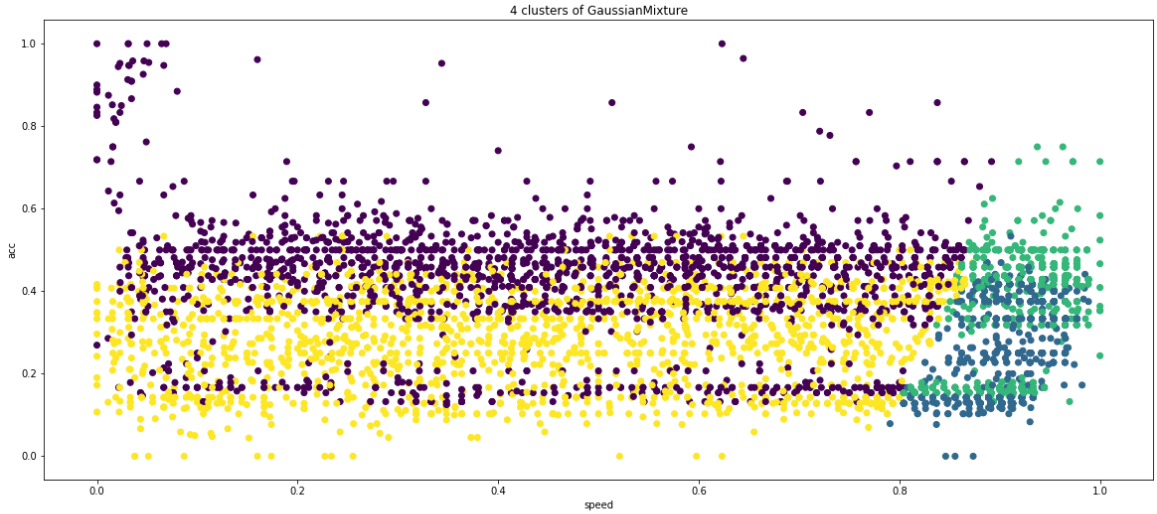
```
# 聚类 2 堆 - 8 堆
n_clusters = 8
figsize_x = 10
plt.figure(figsize=(20, figsize_x * n_clusters))
for i in range(2, n_clusters + 1):
    ax = plt.subplot(n_clusters, 1, i)
    ax.set_title(f'{i} clusters of GaussianMixture')
    y_pred = GaussianMixture(n_components=i).fit_predict(X)
    plt.scatter(X[:, 0], X[:, 1], c=y_pred)
    plt.ylabel('acc')
    plt.xlabel('speed')
plt.show()
```



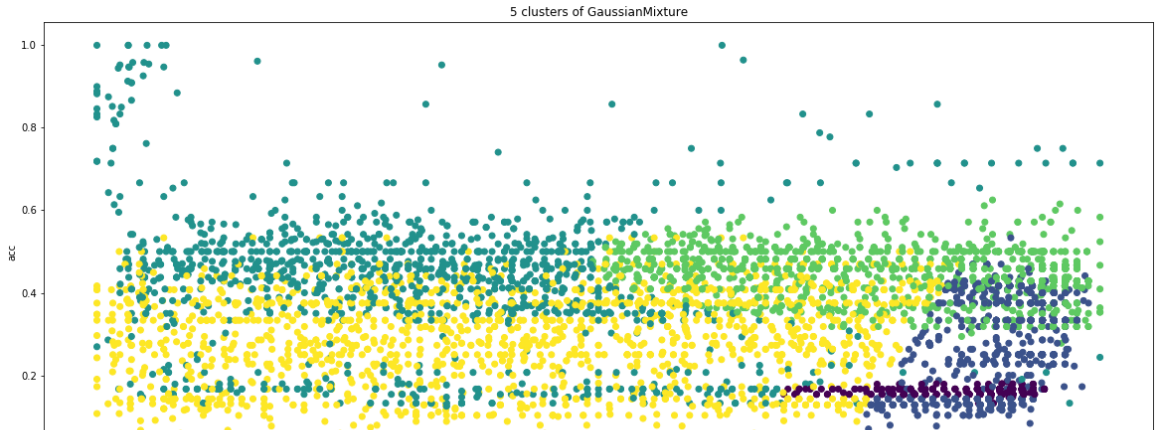
2 clusters of GaussianMixture
acc
speed
0.0
0.2
0.4
0.6
0.8
1.0



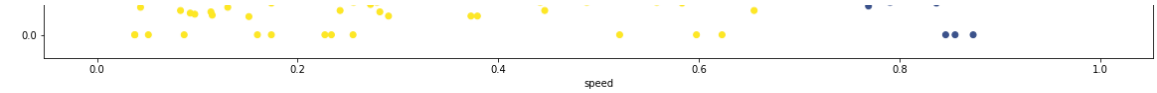
3 clusters of GaussianMixture
acc
speed
0.0
0.2
0.4
0.6
0.8
1.0

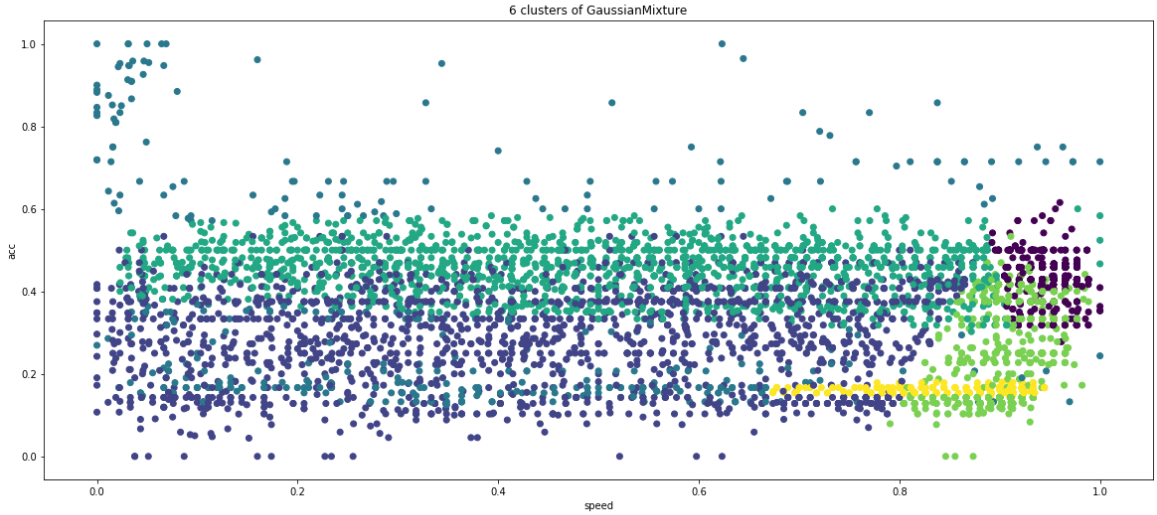


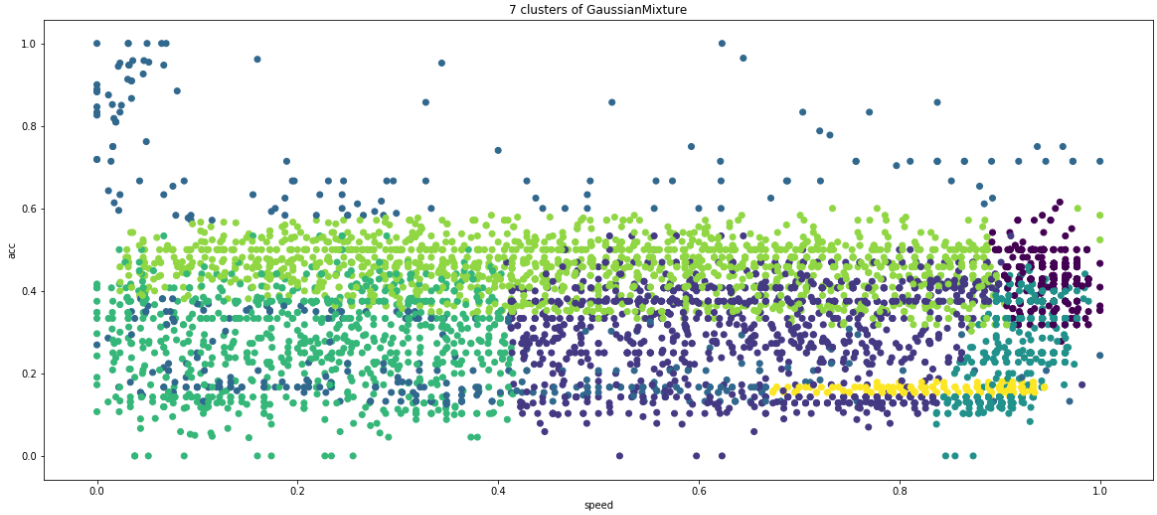
4 clusters of GaussianMixture
acc
speed
0.0
0.2
0.4
0.6
0.8
1.0

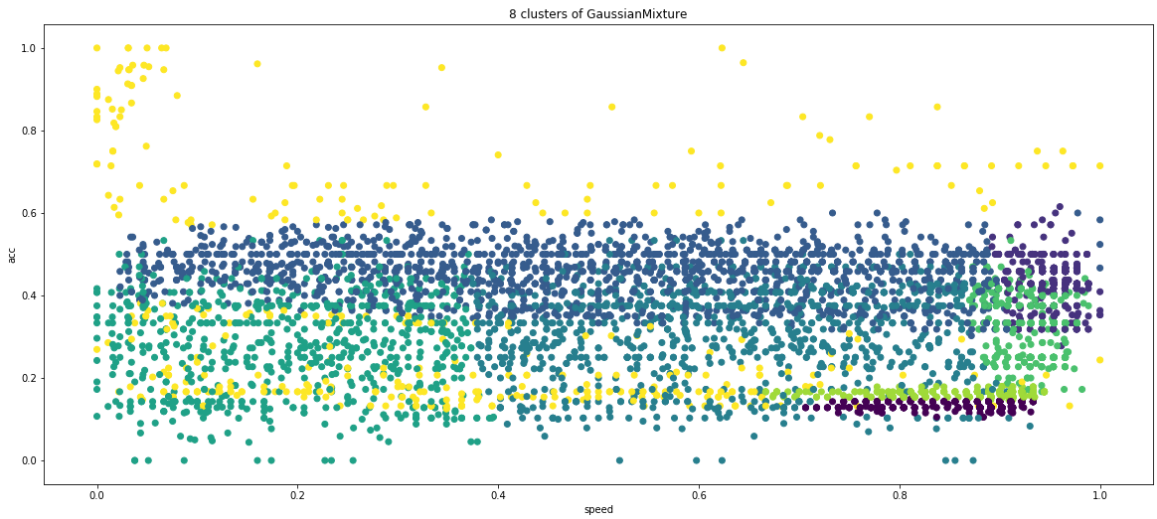


5 clusters of GaussianMixture
acc
0.2
0.4
0.6
0.8
1.0









可以看到混合高斯模型效果还是不错的。

可以详细观测下看看，然后分一下。

下一步就是根据聚类的结果，大体划分下数据集，来做个分类器了。

Fighting!
